Kothe conjecture
Some ring has nil ideal that is not equal {0},in this cituation,this ring has not one side nil ideal that is not equal {0}

Theorem 1.1. *Kothe conjecture is right.*

proof. By reductio ad absurdum,we take some element of one side nil ideal.this element goes to zero by k times multiple. From another side we take multiple k times.All element is nilpotent.We use only associativity and all ring has associativity. This one side nil ideal is nil ideal.It's contradiction,q.e.d. □
